

# The Outlook for Energy

Presentation to the Sunshine Rotary Club

Crises of the past rooted in geopolitical strife and regulatory confusion.

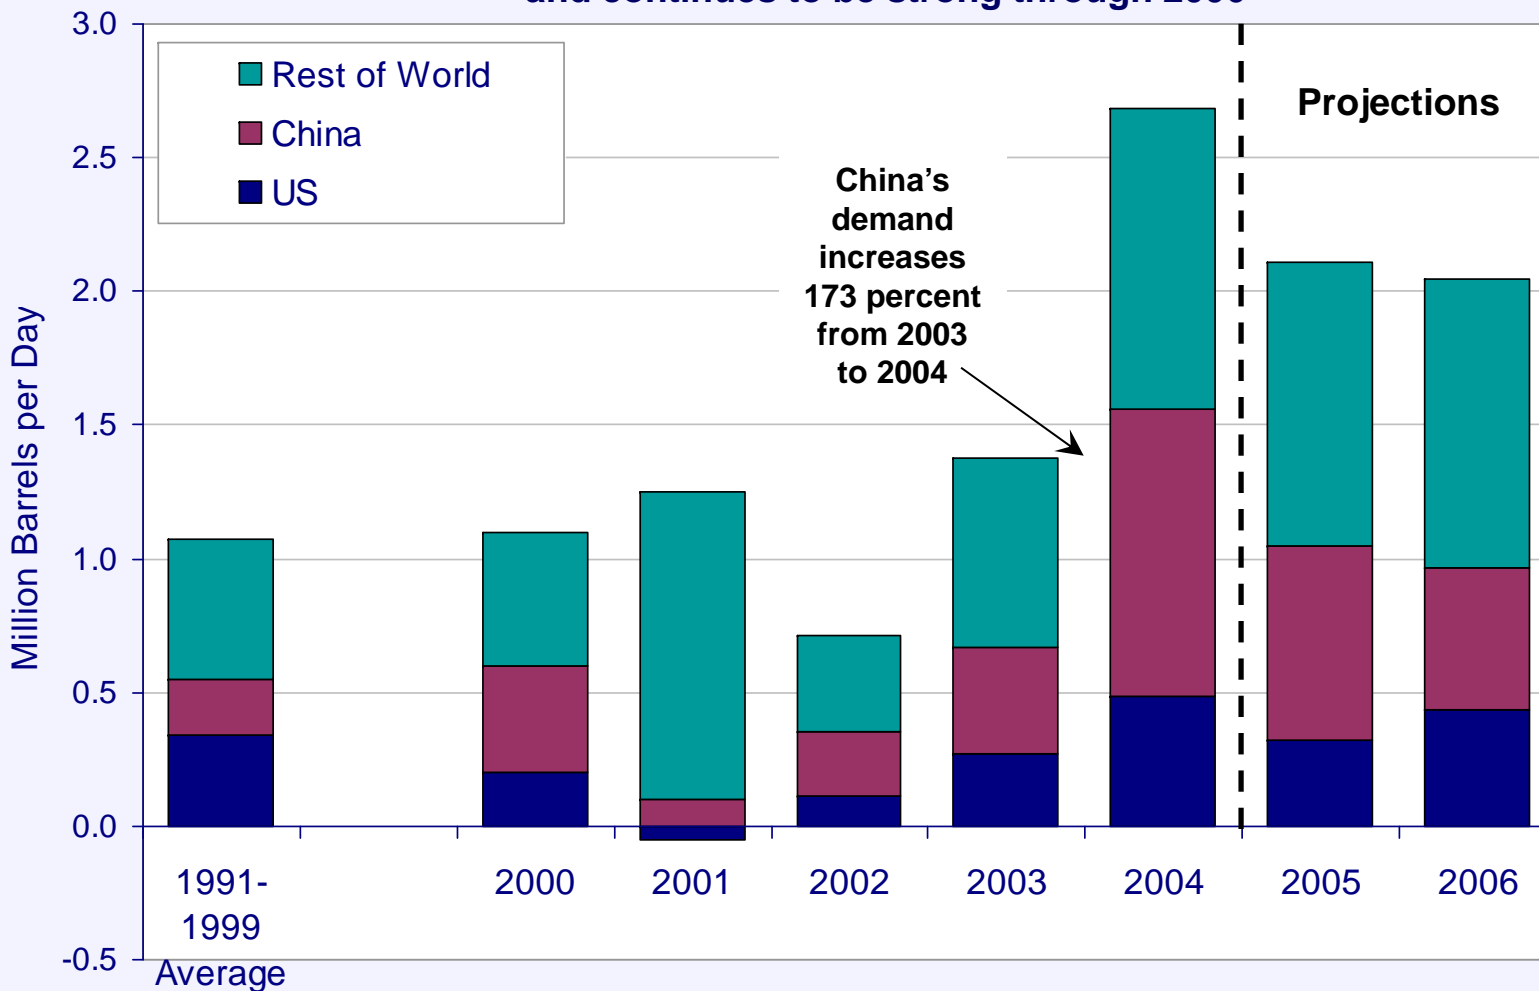

**While geopolitical issues are aggravating today's energy markets, the fundamental source of the problem is clearly rooted in economic fundamentals.**

- **Most basic energy markets are global, and prices are driven by what goes on in global markets.**
  - **Capital is mobile across the globe for energy production decisions.**
  - **Production and output are global in destination markets.**
  - **Prices are traded on recognized hubs, and through recognized institutions, throughout the globe.**
  - **While natural gas has been primarily continental, the development of LNG is pushing these markets towards globalization as well.**

World oil demand growth currently surging at relatively high rates  
and continues to be strong through 2006

1. **Increase domestic production capabilities – but recognizing that we will NEVER be energy independent.**
2. **Increase fuel diversity through market based approaches – coal, nuclear, renewables.**
3. **Increase energy efficiency through market based mechanisms**
  - a. **households**
  - b. **businesses**
  - c. **industry**

- **Continued high prices in near term**
- **Developed world will rely on imports more heavily**
- **Continued demand will put increased pressure on global energy markets**
- **US dependence on foreign energy will increase**
- **Overall problem in real terms is not severe but we are nearing the pressure point**
